

1. Physics 13 &#8211; Lengths, coordinates, and transformations...

## Physics 13 – Lengths, coordinates, and transformations

### Special Relativity

- Einstein (1905) required
  - Laws of Physics are independent of inertial frame *or* one can not detect absolute motion
  - Speed of light is independent of the motion of the source *or*  $c$  is velocity of EM wave in any inertial frame
- Time measurements are relative
- What about length measurements?
- Consider moving ruler of length  $L_0$

2

3. Meter stick length

Meter stick length

$$\Delta t = \Delta t_1 + \Delta t_2 = \frac{2L}{c(1 - \frac{u^2}{c^2})}$$

But  $\Delta t = \frac{\Delta t_0}{\sqrt{1 - \frac{u^2}{c^2}}}$  time dilation

hence  $\frac{2L}{c(1 - \frac{u^2}{c^2})} = \frac{2L_0}{c\sqrt{1 - \frac{u^2}{c^2}}}$

or  $L = L_0 \sqrt{1 - \frac{u^2}{c^2}} < L_0$  (proper length)

• Length Contraction

- moving meter stick "appears" short
- Note: to measure a moving stick must determine position of both ends **simultaneously**.

5. Synchronizing clocks

### Synchronizing clocks

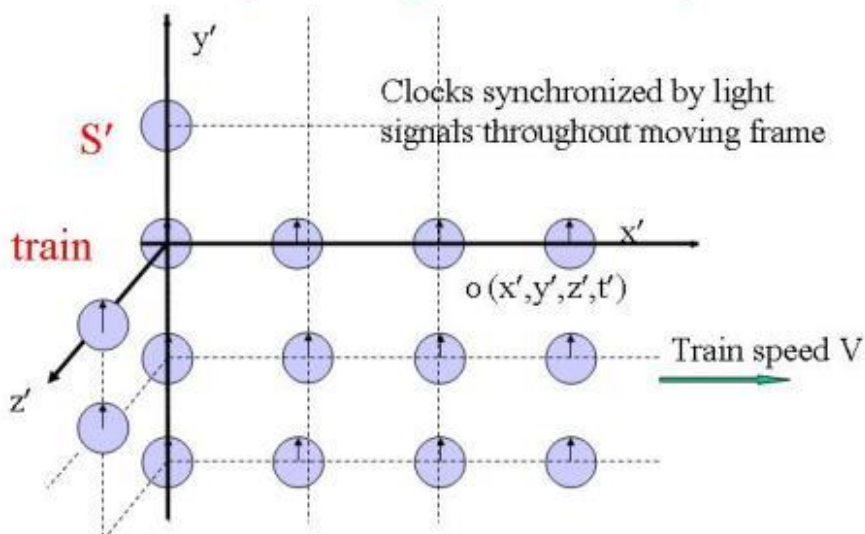

- Clock 1 at  $(x,y,z)=(0,0,0)$  reads  $t_1=0$  when it sends a signal to Clock 2 at  $(d,0,0)$ .
- Clock 2 receives signal at  $t_2=d/c$ . So it must be set to read  $t_2=d/c$  at that moment (not 0).
- When Clock 2 reads  $t_2$  it sends a signal to Clock 3 at  $(2d,0,0)$ . Latter gets signal at  $t_2+d/c$  and is set to display that value.
- Similar procedure is followed for the whole frame.

7

8. Time & space are relative

### Time & space are relative

- Duration (or time elapsed) of physical process depends on Frame
  - Shortest duration in Rest Frame of process
  - All processes are basically physical
- Size of phenomenon (or lengths) depends on Frame
  - Longest length (along motion) in Rest Frame of measuring stick

9/13/2006

Physics 13 - Fall 2001 - Goldstein  
Physics 13 - Fall 04 - G.R. Goldstein  
(c) 2006, Gary R. Goldstein, Ph.D.

8

9. Lorentz transformation

### Lorentz transformation

- Let origins of both frames, S and S', coincide at  $t=t'=0$ . Consider point  $(x,y,z,t)$  in S. In S' :  
 $x' = \gamma (x - Vt)$       $\gamma \equiv 1/\sqrt{1-V^2/c^2}$  (ubiquitous)  
 $y' = y$   
 $z' = z$   
 $t' = \gamma (t - Vx/c^2)$      note signs
- Need  $x,y,z$  AND  $t$  to determine coordinates of space-time point in S' - **space-time continuum**

9/13/2006

Physics 13 - Fall 2001 - Goldstein  
Physics 13 - Fall 04 - G.R. Goldstein  
(c) 2006, Gary R. Goldstein, Ph.D.

9

10. Inverse transformation

### Inverse transformation

- S' point or event  $(x',y',z',t')$   $\Rightarrow$  S  $(x,y,z,t)$ 
  - $x = x'/\gamma + V(t'/\gamma + Vx'/c^2) = V^2x'/c^2 + (x' + Vt')/\gamma$
  - so  $(1-V^2/c^2)x = (x' + Vt')/\gamma = x'/\gamma^2$  or $x = \gamma (x' + Vt')$   
 $y = y'$   
 $z = z'$   
 $t = \gamma (t' + Vx'/c^2)$      note + signs

Physics 13 - Fall 04 - G.R. Goldstein  
(c) 2006, Gary R. Goldstein, Ph.D.

10

11. Example 1 of Lorentz Transformation

### Example 1 of Lorentz Transformation

- **Moving clock:**
  - At rest  $S'$ :  $(x', y', z', t') = (0, 0, 0, \Delta t')$  [after  $(0, 0, 0, 0)$ ]
  - In  $S$ :  $x = \gamma (x' + Vt') = \gamma V \Delta t'$
  - and  $t = \gamma (t' + Vx'/c^2) = \gamma \Delta t'$
  - or  $\Delta t = \Delta t' / \sqrt{1 - u^2/c^2}$  as before
  - Also note  $x/t = \gamma V \Delta t' / \gamma \Delta t' = V$  as expected

9/13/2006

Physics 13 - Fall 2001 - Goldstein  
Physics 13 - Fall 04 - G.R. Goldstein  
(c) 2006, Gary R. Goldstein, Ph.D.

11

12. Example 2 of Lorentz Transformation

### Example 2 of Lorentz Transformation

- **Moving meter stick**
  - In  $S'$ : ends of stick at  $x_1'$  and  $x_2' = x_1' + L_0$  **for all  $t'$**
  - In  $S$ : measure both ends at single time  $t_1 = t_2$ 
    - but  $x_1' = \gamma (x_1 - Vt_1)$
    - $x_2' = \gamma (x_2 - Vt_2) = \gamma (x_2 - Vt_1)$
    - hence  $x_2' - x_1' = L_0 = \gamma (x_2 - x_1) = \gamma L$

9/13/2006

Physics 13 - Fall 2001 - Goldstein  
Physics 13 - Fall 04 - G.R. Goldstein  
(c) 2006, Gary R. Goldstein, Ph.D.

12

13. Simultaneity is relative

### Simultaneity is relative

Two events in  $S'$ :

2 lights ( $x_1'=0$ ) and ( $x_2'=a$ ) turned on simultaneously at  $t'=0$

Or event  $E_1(0,0,0,0)$  and event  $E_2(a,0,0,0)$

In  $S$ :  $x_1 = \gamma x_1' = 0, t_1 = 0$

$x_2 = \gamma a, t_2 = \gamma Va/c^2$  which is later

example :  $V = 0.6c$  then  $\gamma = \frac{1}{\sqrt{1 - (0.6)^2}} = \frac{1}{\sqrt{0.64}} = \frac{1}{0.8} = \frac{5}{4}$

&  $\gamma \frac{V}{c} = \frac{3}{4}$  so  $E_2 = (\frac{5}{4}a, 0, 0, \frac{3}{4} \frac{a}{c})$
